

How to act if your business is under attack

1

Contact an IT-security expert

Consider the situation as a crime scene and wait until the IT-security expert starts an investigation.

2

Don't touch anything

Resist the instinct to immediately turn off all computers, pull out power-cords, shut down accounts or make any changes to the environment.

3

Secure backups

Secure backups so that they are not on any network. On critical systems you can disconnect the network – but do not switch them off!

4

Create a timeline of events

Create a timeline of how you experienced the incident and answer the questions what, when, how and who. Even small details can be incredibly important, when Truesec CSIRT starts to analyze what happened and acts on it.
